Class 9: Candy Analysis Mini Project

Kevin Tan (PID: A16774162)

In today's class we will examine some data about candy from 538

Import Data

```
candy_file <- read.csv("candy-data.csv")

candy = data.frame(candy_file, row.names=1)
head(candy)
```

```
              chocolate fruity caramel peanutyalmondy nougat crispedricewafer
100 Grand             1      0       1              0      0                 1
3 Musketeers          1      0       0              0      1                 0
One dime              0      0       0              0      0                 0
One quarter           0      0       0              0      0                 0
Air Heads             0      1       0              0      0                 0
Almond Joy            1      0       0              1      0                 0
              hard bar pluribus sugarpercent pricepercent winpercent
100 Grand        0   1        0        0.732        0.860   66.97173
3 Musketeers     0   1        0        0.604        0.511   67.60294
One dime         0   0        0        0.011        0.116   32.26109
One quarter      0   0        0        0.011        0.511   46.11650
Air Heads        0   0        0        0.906        0.511   52.34146
Almond Joy       0   1        0        0.465        0.767   50.34755
```

Data Exploration

Q. How many different candy types are in the dataset?

There are 85 candy in this dataset

```
nrow(candy)
```

```
[1] 85
```

Q. How many fruity candy types are in the dataset?

There are 38 fruity candy types

```
sum(candy$"fruity")
```

```
[1] 38
```

My favorite candy vs yours

```
candy["Kit Kat",]$winpercent
```

```
[1] 76.7686
```

```
candy["Warheads",]$winpercent
```

```
[1] 39.0119
```

Q3. What is your favorite candy in the dataset and what is it's winpercent value?

My favorite candy is kitkat and it's winpercent is 76.7686

Q4. What is the winpercent value for "Kit Kat"?

The winpercent for kitkat is 76.7686

Q5. What is the winpercent value for "Tootsie Roll Snack Bars"?

The winpercent for Tootsie Roll Snack Bars is 49.653503

```
library("skimr")
skim(candy)
```

Table 1: Data summary

Name	candy
Number of rows	85
Number of columns	12
_____	
Column type frequency:	
numeric	12
_____	
Group variables	None

Variable type: numeric

skim_variable	n_missing	complete_rate	mean	sd	p0	p25	p50	p75	p100	hist
chocolate	0	1	0.44	0.50	0.00	0.00	0.00	1.00	1.00	
fruity	0	1	0.45	0.50	0.00	0.00	0.00	1.00	1.00	
caramel	0	1	0.16	0.37	0.00	0.00	0.00	0.00	1.00	
peanutyalmondy	0	1	0.16	0.37	0.00	0.00	0.00	0.00	1.00	
nougat	0	1	0.08	0.28	0.00	0.00	0.00	0.00	1.00	
crispedricewafer	0	1	0.08	0.28	0.00	0.00	0.00	0.00	1.00	
hard	0	1	0.18	0.38	0.00	0.00	0.00	0.00	1.00	
bar	0	1	0.25	0.43	0.00	0.00	0.00	0.00	1.00	
pluribus	0	1	0.52	0.50	0.00	0.00	1.00	1.00	1.00	
sugarpercent	0	1	0.48	0.28	0.01	0.22	0.47	0.73	0.99	
pricepercent	0	1	0.47	0.29	0.01	0.26	0.47	0.65	0.98	
winpercent	0	1	50.32	14.71	22.45	39.14	47.83	59.86	84.18	

Q6. Is there any variable/column that looks to be on a different scale to the majority of the other columns in the dataset?

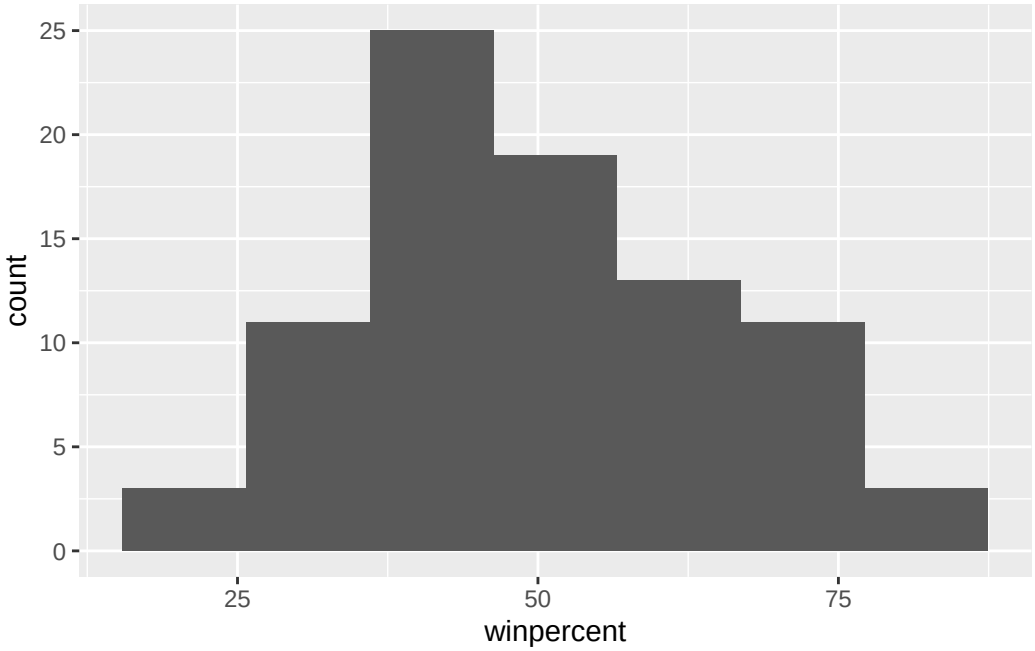
Winpercent is on a different scale (from 1-100)

Q7. What do you think a zero and one represent for the candy$chocolate column?

They show whether the candy in a row is classified as chocolate

Q8. Plot a histogram of winpercent values

```
library(ggplot2)
ggplot(candy) +
  aes(x= winpercent) +
  geom_histogram(bins = 7)
```



Q9. Is the distribution of winpercent values symmetrical?

The distribution is somewhat right skewed

Q10. Is the center of the distribution above or below 50%?

the center (based on the mean) is slightly above 50%. The median is below 50%

```
mean(candy$winpercent)
```

```
[1] 50.31676
```

Q11. On average is chocolate candy higher or lower ranked than fruit candy?

- first find all chocolate candy
- find their winpercent values
- calculate the mean of these values
- then do the same for fruity candy and compare with the mean for chocolate candy

```
choc_wr <- candy$winpercent[candy$chocolate==1]
mean(choc_wr)
```

```
[1] 60.92153
```

```
fruit_wr <- candy$winpercent[candy$fruity==1]
mean(fruit_wr)
```

```
[1] 44.11974
```

Chocolate candy is, on average, higher ranked than fruit candy

Q12. Is this difference statistically significant?

```
t.test(choc_wr, fruit_wr)
```

```
    Welch Two Sample t-test

data:  choc_wr and fruit_wr
t = 6.2582, df = 68.882, p-value = 2.871e-08
alternative hypothesis: true difference in means is not equal to 0
95 percent confidence interval:
 11.44563 22.15795
sample estimates:
mean of x mean of y
 60.92153  44.11974
```

The difference is not statistically significant

Q13. What are the five least liked candy types in this set?

```
head(candy[order(candy$winpercent),], 5)
```

```
                  chocolate fruity caramel peanutyalmondy nougat
Nik L Nip                 0      1       0              0      0
Boston Baked Beans        0      0       0              1      0
Chiclets                  0      1       0              0      0

Jawbusters                0      1       0              0      0
                  crispedricewafer hard bar pluribus sugarpercent pricepercent
Nik L Nip                        0    0   0        1        0.197        0.976
Boston Baked Beans               0    0   0        1        0.313        0.511
Chiclets                         0    0   0        1        0.046        0.325
Super Bubble                     0    0   0        0        0.162        0.116
```

```
Jawbusters                      0    1   0        1        0.093        0.511
                   winpercent
Nik L Nip            22.44534
Boston Baked Beans   23.41782
Chiclets             24.52499
Super Bubble         27.30386
Jawbusters           28.12744
```

```
x <-  c(4,5,6)
order(x)
```

```
[1] 1 2 3
```

The order function returns the sorted indices of the data, which can be used to sort a dataframe. Defaults to ascending order

Q14. What are the top 5 all time favorite candy types out of this set?

```
head(candy[order(candy$winpercent, decreasing=TRUE),], 5)
```

```
                        chocolate fruity caramel peanutyalmondy nougat

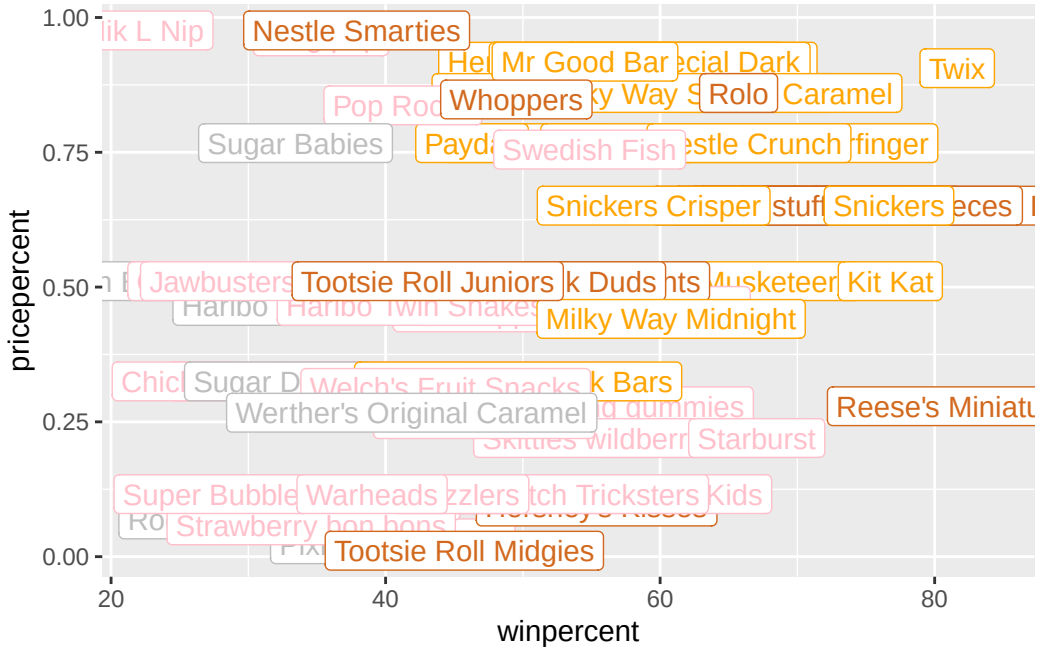
Q17. What is the worst ranked chocolate candy?

Sixlets > Q18. What is the best ranked fruity candy?

Starbursts

Plot of winpercent vs pricepercent

```
ggplot(candy) +
  aes(winpercent, pricepercent, label=rownames(candy)) +
  geom_point(col=my_cols) +
  geom_label(col=my_cols)
```

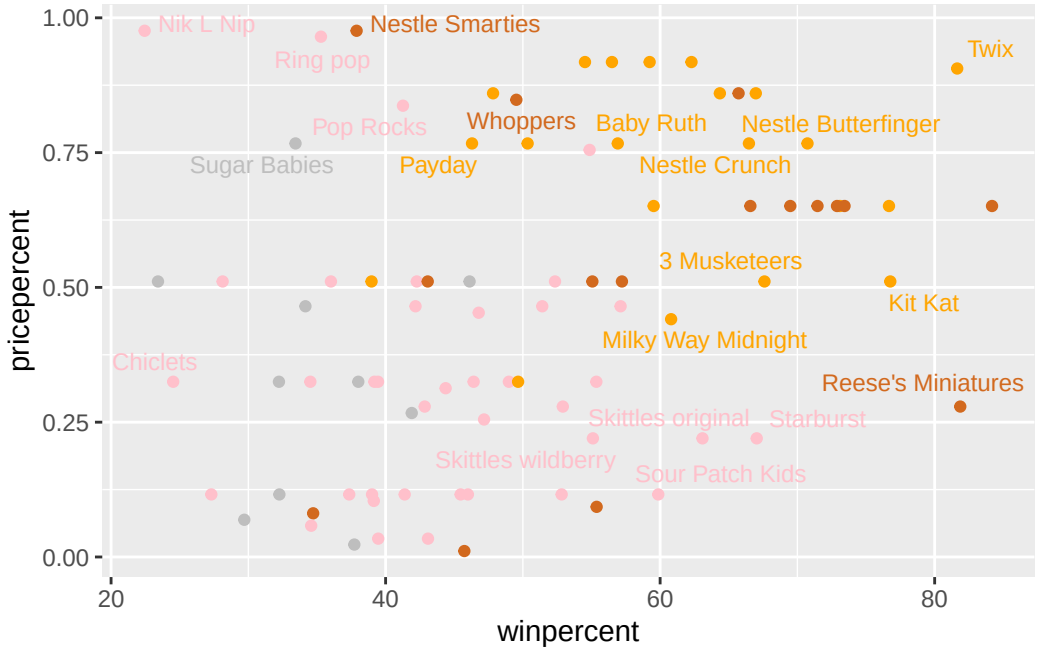


There are just too many labels in this above plto to be readalbe. We can use `ggrepel` package to od a beter job of placing labels so they minimize text overlap

```
library(ggrepel)

ggplot(candy) +
  aes(winpercent, pricepercent, label=rownames(candy)) +
  geom_point(col=my_cols) +
  geom_text_repel(col=my_cols, size=3.3, max.overlaps = 5)
```

```
Warning: ggrepel: 65 unlabeled data points (too many overlaps). Consider
increasing max.overlaps
```



Q19. Which candy type is the highest ranked in terms of winpercent for the least money - i.e. offers the most bang for your buck?

Reese's Miniatures

Q20. What are the top 5 most expensive candy types in the dataset and of these which is the least popular?

```
ord <- order(candy$pricepercent, decreasing = TRUE)
head( candy[ord,c(11,12)], n=5 )
```

```
                      pricepercent winpercent
Nik L Nip                    0.976   22.44534
Nestle Smarties              0.976   37.88719
Ring pop                     0.965   35.29076
Hershey's Krackel            0.918   62.28448
Hershey's Milk Chocolate     0.918   56.49050
```

Nik L Nip is the most expensive and least popular

Correlations

```
library(corrplot)
```

```
corrplot 0.92 loaded
```

```
cij <- cor(candy)
cij

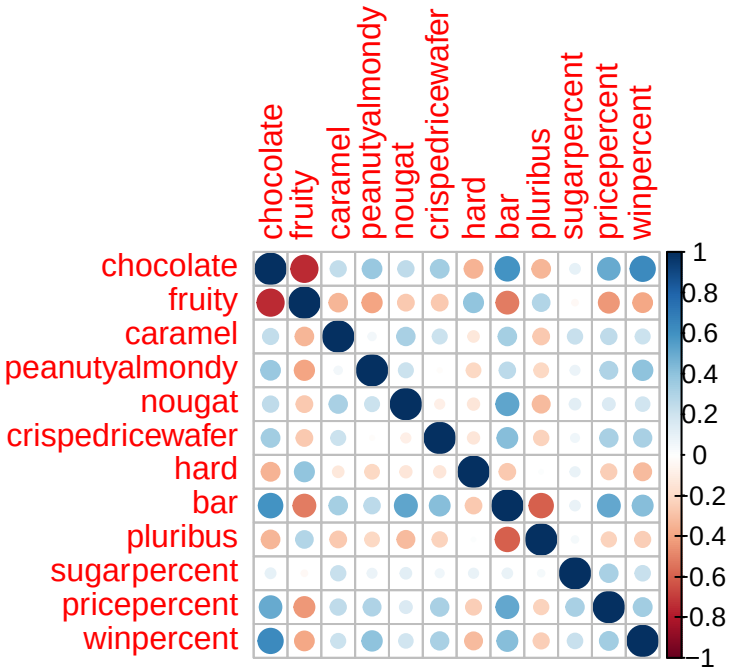
corrplot(cij)
```



Q22. Examining this plot what two variables are anti-correlated (i.e. have minus values)?

Chocolate and fruity

Q23. Similarly, what two variables are most positively correlated?

chocolate and bar

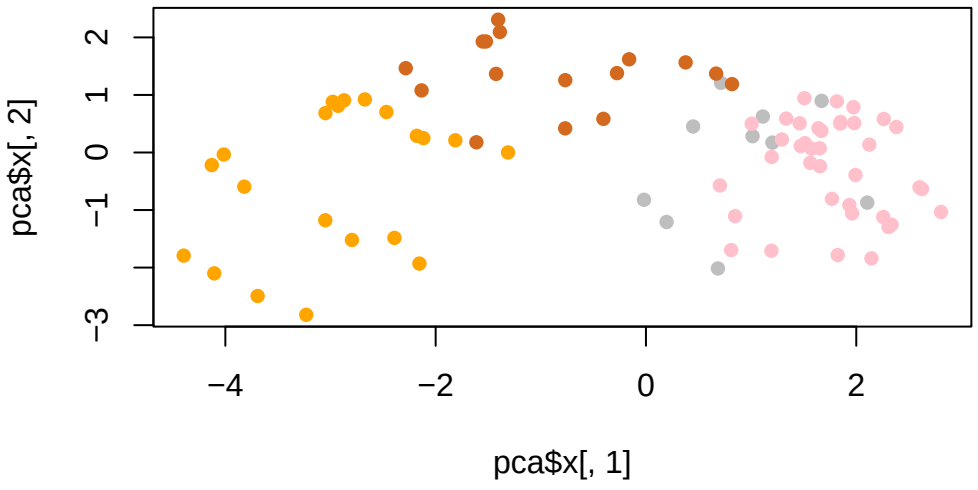
6. Principal Component Analysis

We will perform a PCA of the candy. Key-question: do we need to scale the data before PCA?

```
pca <- prcomp(candy, scale=TRUE)
summary(pca)
```

```
Importance of components:
                          PC1    PC2    PC3     PC4    PC5     PC6     PC7
Standard deviation     2.0788 1.1378 1.1092 1.07533 0.9518 0.81923 0.81530
Proportion of Variance 0.3601 0.1079 0.1025 0.09636 0.0755 0.05593 0.05539
Cumulative Proportion  0.3601 0.4680 0.5705 0.66688 0.7424 0.79830 0.85369
                           PC8     PC9    PC10    PC11    PC12
Standard deviation     0.74530 0.67824 0.62349 0.43974 0.39760
Proportion of Variance 0.04629 0.03833 0.03239 0.01611 0.01317
Cumulative Proportion  0.89998 0.93832 0.97071 0.98683 1.00000
```

```
plot(pca$x[,1], pca$x[,2], col=my_cols, pch=16)
```

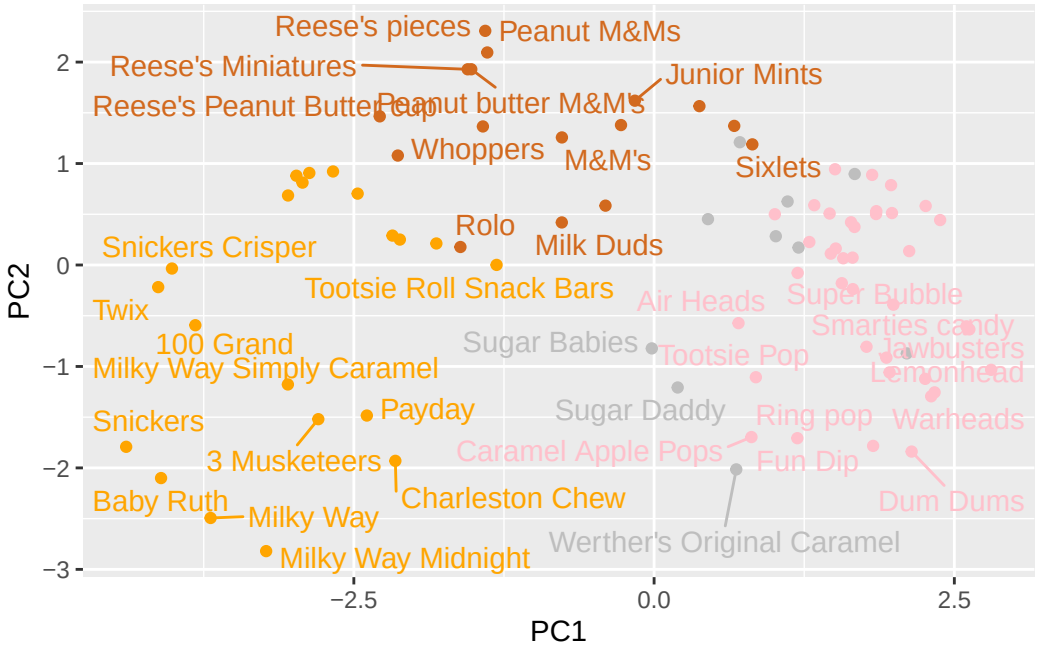


Make a ggplot version of this figure:

```
# Make a new data-frame with our PCA results and candy data
my_data <- cbind(candy, pca$x[,1:3])
p <- ggplot(my_data) +
        aes(x=PC1, y=PC2,
            text=rownames(my_data),
            label=rownames(my_data)) +
        geom_point(col=my_cols) +
        geom_text_repel(col=my_cols)

p
```

```
Warning: ggrepel: 48 unlabeled data points (too many overlaps). Consider
increasing max.overlaps
```

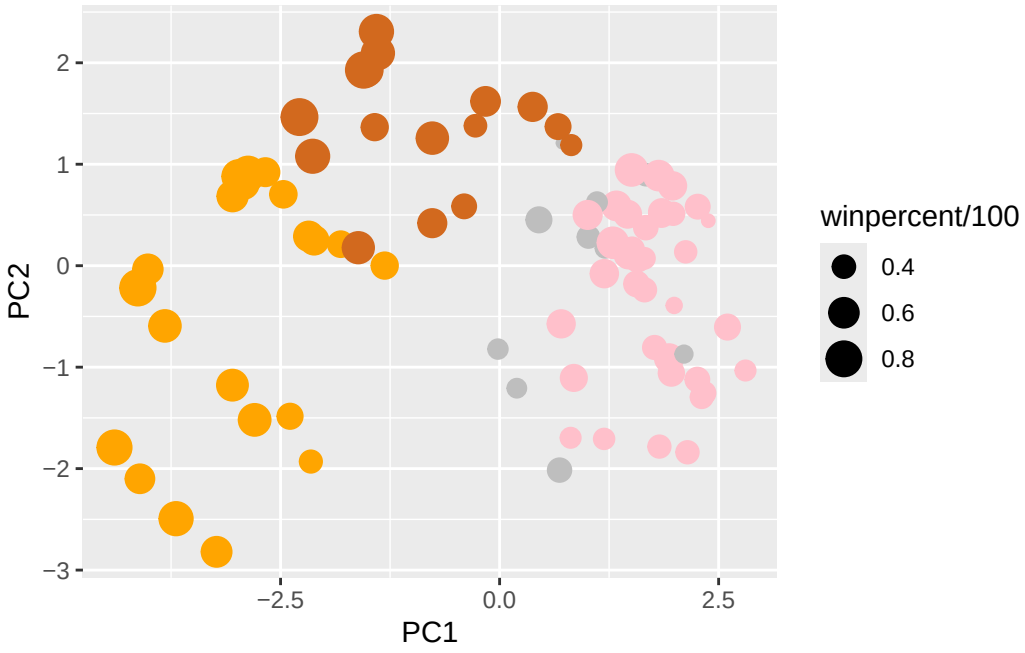


make this a bit nicer

```
p <- ggplot(my_data) +
        aes(x=PC1, y=PC2,
            size=winpercent/100,
            text=rownames(my_data),
```

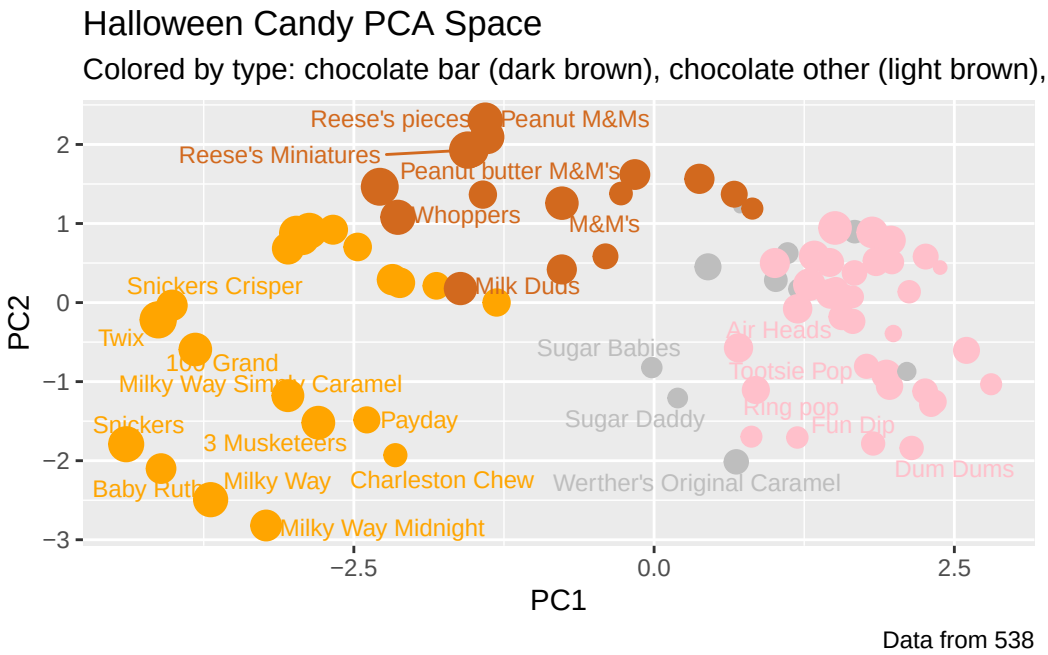
```
            label=rownames(my_data)) +
          geom_point(col=my_cols)

p
```



```
p + geom_text_repel(size=3.3, col=my_cols, max.overlaps = 7)  +
  theme(legend.position = "none") +
  labs(title="Halloween Candy PCA Space",
       subtitle="Colored by type: chocolate bar (dark brown), chocolate other (light brown
       caption="Data from 538")
```

```
Warning: ggrepel: 59 unlabeled data points (too many overlaps). Consider
increasing max.overlaps
```



```
library(plotly)

ggplotly(p)
```

How do the original varibables contribute to our PCs? For this, we look at the loadings component of our results objecct i.e. the `pca$rotation`

```
head(pca$rotation, 5)
```

```
                     PC1        PC2         PC3          PC4         PC5

```

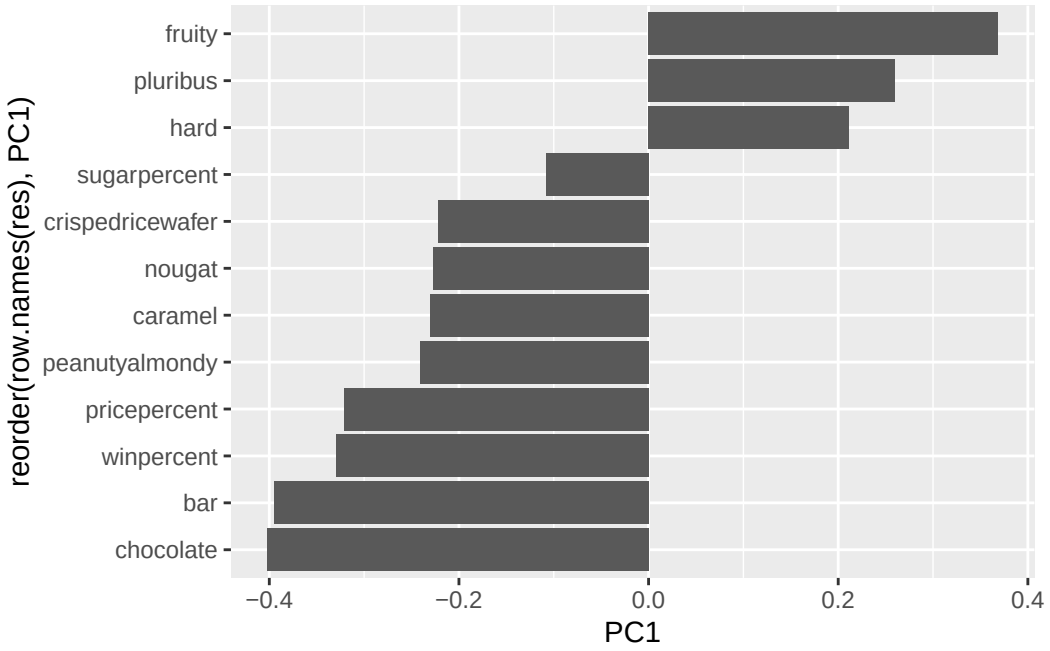
Make a barplot with ggplot and order the bars by their value.

```
res <- as.data.frame(pca$rotation)

ggplot(res) +
  aes(PC1, reorder(row.names(res), PC1)) +
  geom_col()
```



Q24. What original variables are picked up strongly by PC1 in the positive direction? Do these make sense to you?

Fruity, hard, and pluribus are picked up strongly in the positive direction. This makes sense, since fruity candy generally also have the traits of being hard and packaged in a mixed bag.
